

**WHAT IS CLAIMED IS:**

1. A container, comprising:  
5 an injection molded, unitary base comprising:  
supports configured to hold an object and inhibit lateral movement of the  
object; and  
cantilevered retainers configured to inhibit unintentional removal and  
vertical movement of the object when the object is positioned between the  
10 retainers and on the supports.
2. The container of claim 1, wherein at least one of the cantilevered retainers  
comprises a protrusion, and wherein the protrusion is configured to form an interference  
fit with the object to inhibit unintentional removal of the object from the supports.  
15
3. The container of claim 1, wherein at least one of the cantilevered retainers  
comprises a textured surface configured to inhibit removal of the object from the  
supports.
- 20 4. The container of claim 1, wherein the unitary base comprises an electrically  
insulative polymer.
5. The container of claim 1, wherein the unitary base comprises an electrically  
conductive polymer, wherein the polymer is configured to dissipate an electrical charge  
25 at a desired rate to inhibit damage to an object in the container.
6. The container of claim 1, wherein the unitary base comprises a conductive ground  
connector to facilitate coupling the base to electrical ground.
- 30 7. The container of claim 1, further comprising a lid configured to couple to the  
unitary base to close the container.

8. The container of claim 1, further comprising a lid configured to couple to the unitary base to close the container, wherein a portion of a bottom surface of the unitary base is configured to couple to a portion of an upper surface of the lid.

5

9. The container of claim 1, further comprising a lid configured to couple to the unitary base to close the container, and a fastener configured to secure the lid to the base.

10. The container of claim 1, further comprising a lid configured to couple to the unitary base to close the container, and wherein the lid comprises at least one protrusion configured to inhibit removal of an object from the supports when the lid is coupled to the unitary base.

11. The container of claim 1, further comprising a lid configured to couple to the unitary base to close the container, and wherein the lid and the unitary base comprise alignment guides to facilitate coupling the lid to the unitary base.

12. A container for holding a plurality of objects, comprising:  
an injection molded, unitary base comprising:  
a plurality of sets of supports, wherein each set of supports is configured to form a compartment for holding an object; and  
at least one cantilevered retainer for each compartment.

13. The container of claim 12, wherein the plurality of sets comprises a first set of supports configured to hold a first object, and a second set of supports to hold a second object, and wherein the first object has substantially the same shape as the second object.

14. The container of claim 12, wherein the plurality of sets comprises a first set of supports configured to hold a first object, and a second set of supports to hold a second object, and wherein the first object has a substantially different shape than the second object.

15. The container of claim 12, wherein at least one of the cantilevered retainers comprises a protrusion, and wherein the protrusion is configured to form an interference fit with an object coupled to a set of supports to inhibit removal of the object from the supports.

16. The container of claim 12, wherein at least one of the cantilevered retainers comprises a textured surface configured to inhibit removal of an object coupled to a set of supports.

17. The container of claim 12, wherein the unitary base comprises an electrically insulative polymer.

18. The container of claim 12, wherein the unitary base comprises an electrically conductive polymer, wherein the polymer is configured to dissipate an electrical charge at a desired rate to inhibit damage to an object in the container.

19. The container of claim 12, wherein the unitary base comprises a conductive ground connector to facilitate coupling the base to electrical ground.

20. The container of claim 12, further comprising a lid configured to couple to the unitary base to close the container.

21. The container of claim 12, further comprising a lid configured to couple to the unitary base to close the container, wherein a portion of a bottom surface of the unitary base is configured to couple to a portion of an upper surface of the lid.

22. The container of claim 12, further comprising a lid configured to couple to the unitary base to close the container, and a fastener configured to secure the lid to the base.

23. The container of claim 12, further comprising a lid configured to couple to the unitary base to close the container, and wherein the lid comprises at least one protrusion configured to inhibit removal of an object from the supports when the lid is coupled to the unitary base.

5

24. The container of claim 12, further comprising a lid configured to couple to the unitary base to close the container, and wherein the lid and the unitary base comprise alignment guides to facilitate coupling the lid to the unitary base.

10 25. A method of storing an object in a container having an injection molded, unitary base, comprising:

grasping the object;

positioning the object above a support;

forcing the object past a retainer to seat the object on the support; and

15 inhibiting removal of the object from the support by an interference connection between a portion of the retainer and a portion of the object.
